

Frogs

BY: Liela Haberl and Grace Scmitt

Are frogs amphibians?

Frogs are a type of amphibian they are thinner than toads and jump higher than toads. It's not likely that you will see a frog that is dry they are really mostly wet and slimy.

Which frogs should you touch?

There are lots of different frogs and they all are different. Some frogs are colorful but be warned do not touch the colorful ones because they are poison

How are frogs Born?

When frogs are born their not baby frogs their tadpoles which first forms and it looks Sorta like an eyeball than it hatches and it becomes somewhat like a fish/tadpole than that tadpole grows legs and than get rid of the tail and becomes a frog than gains it's eye catching green color.
