

This is an American Toad. They are very common in Ohio.

1

The Early Stage

http://www.californiaherps.com/frogs/pages/a_punctatus.html, 3/12/19

A female lays thousand little black eggs, that look like a little ball. A couple days later they slide out and have no eyes or tail.

2

Mating

Once a female toad is completely grown and then takes a male frog (that is also completely grown to the mating pond. It is there they mate and then the female lays her eggs.

3

Diseases

Toads give people salmonella. Salmonella is a bacteria that toads and other amphibians carry. If a toad would give a human salmonella, the human would be very sick and ill. Not only can toads give it to humans, but they can give it to other amphibians.

Benefits

Toads can be found in gardens, they can eat all insects from your garden that way they won't eat your fruits and vegetables.

Habitat

As a baby most frogs live by the pond. As they soon to grow older, into the adult stage, they wonder more and walk freely.

Nuisance/Beneficiary:

Toads are nuisance because the poisonous toads can invade your neighborhood and can harm you/your animals. They are also beneficiary because they can eat insects that are around your house.

4

Foodweb

This is a Toad's food web. Toads eat a lot of insects and even small snakes.
